DRAWMER M-500

The M500 is a multifunction signal processor capable of performing the majority of dynamic signal processing tasks required by the professional audio industry. It can simulate the function of compressors, limiters, expanders, gates and has the facility for de-essing, autopanning and fading. Also available are two filter sections which may be assigned either to the de-esser, gate or split-band compressor programmes.
The gate can record real sounds and store up to 16 of these in memory, and then use these to modify the envelopes of other sounds.
