GEORGE MASSEMBURG LAB 8302 MODULO
PREAMPL.2CH. NO PSU (8355)

GML Microphone Preamplifiers are world renowned for their life-like realism, high resolving power, and reference-standard transparency. Why? Their all-discrete, bipolar transistor circuit topologies are completely transformerless with no FET's, IC's, or electrolytic capacitors in the signal path. Even the outputs are direct-coupled' time-proven active servos remove DC without adding any artificial color.

15dB to 70dB of Gain is front panel selectable in accurate 5dB steps. A +24dBv CLIP indicator warns of any impending overloads and switchable phantom powering is built in. The 8302 two-channel Mic Pre fits compactly in only 1U of rack space. Includes a well built aftermarket power supply.
