VIC FIRTH SIH2 STEREO ISOLATION HEADPHONES

We have gone back to the drawing board to make one of our most popular hearing protection products, the Stereo Isolation Headphones even better.

The new Stereo Isolation Headphones Version 2 (SiH2) features a redesigned larger driver in the ear cups that deliver a more powerful low end, cleaner mids and clear highs for a superior sound.

Overall noise levels are reduced by 25 decibels, so that music can be listened to and played along with at safe volume levels. And the improved padded headband creates a more comfortable fit, making them enjoyable to wear for extended periods of time.

With the upgraded sound quality of these headphones, they are great for practicing, performing, or just listening to music in a loud environment.

Vic Firth has a long history in educating drummers about the potential long-term negative effects that high sound levels can have on musicians' hearing. Prolonged exposure to the excessive levels of noise from instruments can cause hearing fatigue, tinnitus and permanent hearing loss. To aid in protecting one of our most valuable assets, Vic Firth Company has developed a collection of products that will reduce the exposure to the extreme decibel levels, including the isolation headphones, and high fidelity earplugs.
