VISUAL SOUND H2O LIQUID CHORUS / ECHO V1

VISUAL SOUND H2O LIQUID CHORUS / ECHO V1

H2O Liquid Chorus & Echo continues the Visual Sound tradition of combining two professional quality effects into one pedal. First, you get liquid analog chorus created by using rare NOS BBD ("bucket brigade") chips. With controls for Speed, Width, and Delay Time, you can get an endless variety of chorus sounds from subtle to lush to under water. Then there's the echo channel. Up to 800ms of analog voiced, digital echo. You can switch from short to long echo times on the fly and dial in just the right settings with the familiar controls: Echo Time, Repeats, and Effect Level.

H2O even has a second output jack for sending a dry (unaffected) signal to a second amp. And if you prefer to have an effected signal going to your second amp, the pedal can be easily modified to accomodate that.

Like other Visual Sound pedals, you can use either channel by itself or combine them together. Just stomp on both switches at the same time to switch from one channel to the other or to turn them both on or both off.
